

Blocks on Bradstone Bedding Aggregate, a 6mm angular, open graded material. The laying course should be 50mm thick and it is not compacted before the blocks are laid. Geotextile layer with lapped joints of 300mm 350mm thick graded sub-base of 20-5mm diameter Carboniferous Limestone. Bradstone 3mm Jointing Aggregate is used for joint filling. Brush in and after ensuring there is not loose aggregate on the surface that could mark the blocks, another pass with the whacker is required. Finally, brush in more aggregate to fill voids as required.
