1.0 Introduction

Geo² Remediation Limited were commissioned by JHA Pulmann to conduct a Phase I / II Contaminated Land Site Assessment of a site:

Land off Waterfold Lane,
Heywood,
Bury,
BL9 7JY

The site is approximately 0.25 hectares in area and located at grid reference 382320, 410350.

The study was undertaken prior to proposed redevelopment of the site for residential end use, with outline planning permission obtained for the site (ref. 21/01345/OUT). Existing and current proposed plans for the site can be referred to within Appendix A.

1.1 Scope of Works

The Preliminary Risk Assessment, consisting of desk study and site walkover, was conducted in order to assess the potential for contaminant sources to be present on site, resulting from the past use of the site and current land use.

The desk study was also undertaken to identify possible sensitive environmental receptors that may be at risk from sources, if present on site, within the locality of the site.

The scope of the Preliminary Risk Assessment has given consideration to guidance on Land Contamination: Risk Management pages of the GOV.UK web pages, the relevant requirements of the National Planning Policy Framework (NPPF) (as revised 2023) (paragraphs 180 & 189-191) and the Planning Practice Guidance (Land Affected by Contamination).

2.0 Description of the Site and Surroundings

2.1 Site Description

The site is located off Junction 2 of the M66, approx. 3km west and 1.7km east of the towns of Heywood and Bury, Greater Manchester. Figures 1 and 2 in Appendix A show the location of the site.

The site is currently vacant, having historically been allotment gardens. In recent years, all previous allotment buildings have been removed / demolished.

The area shown within the red site boundary on Figure A below, will be referred to throughout this document as 'the site'.

The site is located east of Waterfold Lane, to the rear of terraced housing dated from the 1860s. Waterfold Lane is accessed from the A58 Bury New Rd to the north.

Figure A: Site Location Plan. Red is approximate site boundary and pink are 50m and 100m buffers.
Extract from Envirocheck report (Appendix C).

2.2 Site Walkover

An initial site walkover was undertaken on 8th November 2023 and the site investigation works undertaken on 26th March 2024, with a photographic survey included in Appendix B. Images 1-10 date from November 2023 while images 11-16 are from during the ground investigation. The site walkover findings are detailed below.

The site is located to the rear of a row of terraced houses, with other residential properties located to the north and northwest. Hardstanding in poor condition separates the site from the housing to the west. The eastern side of the site slopes upwards.

The site is currently vacant former allotment land, generally overgrown. The majority of former sheds and glasshouses have been demolished. An existing site plan is included in Appendix A which shows the location of buildings in June 2020. Only a few garages remain by late 2023/ early 2024, generally on the western boundary.

The concrete floor slabs of former sheds can be seen around the site, with glass fragments also evident where glasshouses had once stood.

Evidence of a relatively recent bonfire was seen in the northern part of the site. Suspected asbestos fragments were observed in made ground within TP5, located in the northern part of the site.

2.3 Site Surroundings

The site is located west of the town of Heywood and east of Bury, located off Junction 2 of the M66. The nearest residential properties are situated from 10m west. The surrounding land uses of the site are summarised in Table 2 on the following page.

Direction	Land Use
North	Residential housing and a field
East	Residential property and farmland
South	Farmland
West	Terraced housing, Waterfold Lane, River Roch, farmland and M66 beyond

Table 2. Land Uses in the Surrounding Area.

3.0 Desk Study

3.1 Desk Study Data

Information regarding the environmental setting of the site was obtained from the Envirocheck report, which collated information from a variety of sources. A copy of the Envirocheck report is presented in Appendix C.

Where indicated in Table 3 below, the data from the Envirocheck report has been supplemented with additional information obtained from freely available online data.

Site Geology	British Geological Survey (BGS) data indicates bedrock consists of Pennine Lower Coal Measures and the Milnrow Sandstone across the eastern and western areas of the site respectively. Superficial deposits are indicated to comprise Devensian Till, although Alluvium and River Terrace Deposits are mapped to the north and west, likely associated with the River Roch, which may encroach onto site. The Envirocheck report shows the site has the following risk ratings associated with these ground stability hazards: • Collapsible ground stability – no hazard. • Compressible ground stability – no hazard. • Ground dissolution – no hazard. • Landslide ground stability hazard – low risk. • Running sands stability hazard – very low risk. • Shrinking or swelling clay stability hazard – very low hazard. A moderate risk is identified with respect to compressible ground stability 7m northwest, potentially associated with the alluvium deposits.
Mining	There are no BGS Recorded Mineral Sites within 500m of the site. Moor Hole Sand Pit was located 606m southeast and is no longer operational. A review of the Coal Authority online interactive mapping indicates that while the site is located within a coal mining reporting area, the site is not located within a Development High Risk Area (DHRA) and the nearest recorded coal is located from 350m south. Therefore, the risk to the proposed development from shallow coal mining is considered to be Low.
Radon	The site is in low and intermediate probability radon areas. As such, no radon protective measures are necessary in the construction of new dwellings or extensions.

Site Hydrogeology	The bedrock and Alluvium to the north is classified as a Secondary A Aquifer – Permeable layers capable of supporting water supplies at a local rather than strategic scale, and in some cases forming an important source of base flow to rivers. The superficial deposits across the eastern side of the site are classed as a Secondary Undifferentiated Aquifer – defined where it is not possible to apply either a Secondary A or B definition because of the variable characteristics of the rock type. The site is not located within a Source Protection Zone. There are 4no groundwater abstraction points within 1km, with the closest located 118m south at Spout Bank Farm for general agricultural use. There are no potable groundwater abstraction points within 1km. The groundwater beneath the site in the combined productive bedrock and productive superficial aquifers has been classed as low vulnerability.
Site Hydrology	The nearest surface water feature is the River Roch located 27m west, flowing westwards with a river quality C. There are no pollution incidents to water recorded within 200m of the site. The nearest discharge consent is located 78m northwest, upstream of the site and operated by United Utilities for storm sewage overflow. The nearest surface water abstraction point is located 349m northeast at Heap Bridge Weir for the production of hydroelectric power.
Waste and Infilled Land	There are no historical landfills, BGS recorded landfills or operational landfills within 500m of the site. The nearest licenced waste management facility is located 288m south at Pilsworth North Landfill. There are no areas of potentially infilled land (non-water) within 600m of the site. There are 3no areas of potentially infilled land (water) within 500m, with the closest located 252m northeast.
Unexploded Ordnance (UXO)	A review of Zetica online risk mapping for the area indicates the site is located in a Low-risk area with respect to UXO.

Table 3. Environmental Assessment of the Site.

4.0 Site History

Details regarding the development of the site, its immediate surroundings and potentially contaminative land uses were obtained from a review of historical maps.

Copies of the maps are provided in Appendix C and a detailed summary provided in Table 4 below and on the following page. All distances given are approximate and are relative to the site, unless otherwise stated.

Date	On-Site	Off-Site	Potential Contamination
1851	The site forms part of a wider undeveloped field.	The surrounding land use principally comprises undeveloped agricultural land, with Heap Bridge village located from 150m north. The River Roch is located approx. 30m west and a railway line is located 200m south, aligned east–west.	N/A
1893 – 1911	The western side of the site has been partially developed with some small buildings shown. By 1910, the entire site has been set out into smaller plots, which extend beyond the southeastern and northern boundaries.	Terraced housing has been established directly west of the site by the 1890s, as Heap Bridge village expands. Water (woollen) Mill is located from 100m west, with associated reservoirs, filter beds, tanks and tenters. A Paper Mill and Heap Bridge (woollen) Mills with a Gasometer are located from 150m northeast and north. A new railway line has been constructed from 50m southeast, joining the main line 200m south.	Potential for made ground soils associated with construction works. Potential for asbestos fragments associated with AC roof sheeting
1930 – 1939	The site remains relatively unchanged, with small buildings across the area.	Land to the east and south remains as undeveloped farmland while Heap Bridge to the north continues to expand. More terraced houses are constructed to the southwest. The Woollen Mill 100m west is mapped as disused by the 1930s, with cricket ground and tennis courts established south of the mill. Bridge Hall Dye Works is established from 150m north, on the opposite side of the River Roch.	

Date	On-Site	Off-Site	Potential Contamination
1955 – 1970	The site and land directly north are labelled as Allotment Gardens, with buildings/sheds having changed since the 1930s. A water course is shown to issue in the southeastern corner and flow into the centre of the site where it sinks.	The majority of the Woollen Mill buildings from 100m west have been demolished and the land now occupied by an unnamed Works. A pond, tank and small water course are mapped 90m south of the site, flowing towards the River Roch to the west.	Potential for contamination arising from demolition and construction of allotment sheds. Potential for asbestos fragments associated with AC roof sheeting
1980 – 2023	The site remains as allotment gardens. The water course is no longer mapped on site.	The works and cricket ground to the west have been removed, with the construction of the M66 motorway aligned north-south. The railway line 50m southeast has been dismantled.	

Table 4. Detailed Summary Review of Historical Mapping

Table 5 below provides a brief summary of the historical land use on site and local to the site.

Key Historical Activities	
On-Site	Initially mapped as undeveloped / agricultural land, later used as allotment gardens with various small buildings (sheds) mapped. A water course is shown to issue and sink across the site during the 1950s to 1970s.
Off-Site	Principally undeveloped / agricultural land use up to the late 1890s, with local industrial land use dominated by woollen and paper mills 100-200m west. A railway line is constructed 50m southeast by the 1890s, dismantled by the 1980s. Heap Bridge village expands from the 1850s, with terraced housing constructed west of the site. The M66 motorway is constructed from 150m west by the 1980s.

Table 5. Brief Summary of Historical Land Use On-Site and Off-Site.

5.0 Preliminary Risk Assessment

5.1 Source – Pathway – Receptor

UK legislation and guidance on assessing potentially contaminated land recommends the use of a risk assessment process based on a review of source/pathway/receptor relationships for various environmental media. The first stage of any risk assessment is to identify, using the desk study data and site information, the presence and extent of any hazard at the site, theoretical or demonstrable.

A key component of the overall risk assessment process is identification of “significant contaminant linkages” between contaminants and receptors. This can be accomplished through development of a site-specific conceptual model in which the potential contaminants, pathways and receptors identified on-site are described.

Each element can be defined as follows:

- **Contaminant source:** A substance either on or under the land and which has the potential to cause harm or pollution to human or environmental receptors.
- **Pathway:** A route or means by which a receptor can be exposed to or affected by a source.
- **Receptor:** A living organism or an ecological system, or controlled water, or property including buildings, crops and livestock.

The presence of all three of the above elements identifies a contamination linkage and a potentially unacceptable risk. To ensure that any risk present to, or, from the site can be appropriately managed each of these contamination linkages will be targeted by the investigation.

5.2 Hazard Identification

5.2.1 Potential On-Site Sources

Potentially contaminative on-site activities relate to the use of the site as allotment gardens from the late-19th century. It is possible that asbestos cement (AC) sheets were used as roofing for allotment sheds. Anthropogenic material such as glass, ceramics and brick may be present in shallow soils.

Due to the age of buildings on site, it is likely that asbestos materials were used in the construction of the buildings, leading to a potential for asbestos fibres in shallow Made Ground soils.

While no landfills or areas of potentially infilled land have been identified on site or within close proximity to the site, the potential presence of Alluvium and organic superficial deposits on or close to the site may be a source of noxious ground gases.

5.2.2 Potential Off-Site Sources

No off-site sources of contamination have been identified within close proximity to the site.

5.3 Initial Conceptual Site Model

Contamination linkages arise as a result of the interconnection of the contaminant source, contamination pathways and potential receptors. These contamination linkages are used to design the site investigation (if required), guiding the type of investigation, location of exploratory boreholes and the required sample analysis.

5.4 Risk Estimation

The objective of the qualitative risk assessment is to determine the significance of the risk, if any, which may occur as a result of the creation of pollutant linkages, which connect a potential receptor to an identified potential contaminant source at the site.

The perceived risk is based on a consideration of both the likelihood of an event (probability) occurring, and the severity of the potential consequence. Classification of these two factors is detailed in Appendix F.

5.5 Preliminary Qualitative Risk Assessment

A qualitative risk assessment is undertaken, detailed in Table 6 below and on the following page, in line with guidance provided in CIRIA's Contaminated Land Risk Assessment: a guide to good practice CIRIA C552, 2001. The purpose of this assessment is to determine the relative significance of the identified contamination linkages by assessing the probability of an impact occurring and by assessing the perceived severity of an impact to a receptor.

Those linkages considered of low risk or less on the basis of the available site data will not be considered any further in this assessment. Linkages considered to be more significant are identified as presenting potentially unacceptable risk to the identified receptor. In these instances, further works may be considered necessary.

Source	Pathway	Receptor	Preliminary Risk Assessment (Probability x Severity)
Potential contamination associated with made ground soils on site related to the use of the land as allotment gardens since the late-19 th Century.	Leaching to groundwater, lateral and vertical flow, followed by migration within the aquifer.	Surface water: River Roch located 27m west, river quality C	Low (Low Likelihood x Mild)
		Groundwater: Secondary A Aquifer within Alluvium and bedrock deposits	Moderate / Low (Low Likelihood x Medium)

Source	Pathway	Receptor	Preliminary Risk Assessment (Probability x Severity)
Potential contamination associated with made ground soils on site related to the use of the land as allotment gardens since the late-19 th Century. Potential for asbestos fibres in shallow soils and for asbestos containing materials (ACM)	Direct contact and ingestion of contaminants and inhalation of asbestos in soils and dust	Human Health: Residential End Users	Moderate (Likely x Medium)
		Human Health: Construction Workers	Moderate (Likely x Medium)
Potential for noxious ground gases arising from organic and Alluvium superficial deposits	Inhalation within enclosed spaces	Human Health: Residential End Users	Moderate (Likely x Medium)

Table 6. Identified Initial Contamination Linkages

6.0 Site Investigation

In order to provide an assessment of each of the identified contamination linkages, a shallow intrusive investigation was specified to obtain further information regarding the geology of the site and the quality of the soils and groundwater.

6.1 Site Investigation

Seven machine excavated trial pits (TP01 to TP07) were advanced on 26th March 2024 to depths of up to 3.0m below ground level (m bgl). An exploratory hole location plan, showing the approximate locations of the trial pits, is included in Appendix A.

The trial pits were advanced using a JCB 3CX, with disturbed soil samples obtained by the Geo² engineer for field and laboratory analysis and for logging of ground conditions. Field analysis comprised the examination of each of the samples for visual and olfactory indications of contamination. Analysis was also conducted for volatile hydrocarbons using a photo-ionisation detector (PID).

Trial pit positions were chosen to provide a general site coverage. Exploratory holes were surveyed, with co-ordinates and ground levels for each trial pit added to the exploratory hole logs.

6.2 Ground Conditions

The logs of the trial pits, which are presented in Appendix D, detail the ground conditions with the visual and olfactory characteristics of the soils.

Ground conditions encountered across the site comprised 0.10-0.30m thick silty topsoil over granular made ground. Made ground soils were described as sand or gravel and included sandstone, concrete, brick, coal, clinker and some glass and ceramics. While only 0.30m thickness of made ground was encountered in TP7 located in the southeastern corner, the trial pits typically recorded made ground soils to depths of 1.50-2.40m bgl.

Natural soils were indicative of Alluvium superficial soils and included soft to firm clay with peat or organic horizons or pockets in TP01 to TP06. TP07 in the southeastern boundary recorded sand underlain by stiff clay.

No groundwater was encountered during the shallow investigation.

All trial pits were backfilled with the arisings upon completion.

6.2.1 Obstructions

No obstructions were encountered during the ground investigation.

6.2.2 Observed Potential Contamination

Anthropogenic material was observed within the granular made ground, including concrete, brick, coal, clinker and some glass and ceramics.

Fragments of suspected asbestos cement were identified within the made ground in TP05, with a photo included in Appendix B for reference. No other visual or olfactory evidence of contamination was observed by the engineer.

As detailed within the exploratory hole logs included in Appendix D, no elevated PID readings were recorded within site soils during the investigation which would indicate volatile contamination being present. Slightly elevated readings (maximum 4.5ppm) were recorded corresponding to peat or organic clay layers.

7.0 Laboratory Analysis

7.1 Analysis Rational

Eight soil samples were selected for laboratory analysis for a broad environmental suite reflecting the limited historical land use of the site and the proposed Residential development in line with guidance provided in CIRIA's Contaminated Land Risk Assessment: a guide to good practise (CIRIA C552, 2001).

All samples were placed in laboratory provided containers and stored in cool boxes prior to being transported to the laboratory under the laboratory's chain of custody documentation. The laboratory used for the ground investigation on this occasion was Envirolab, a UKAS and MCERTS accredited laboratory.

7.2 Soils Analysis

Six made ground and two natural clay soil samples were analysed for a broad environmental testing suite, including pH, sulphate (water sol 2:1), heavy metals, chromium III and IV, asbestos ID, PAH-16 and TPH-CWG.

The soil samples were selected from a range of depths and from across the site, to gain an understanding of site-wide ground conditions.

The analysis, conducted by a Gas Chromatography / Flame Ionisation Detector (GC/FID) and Gas Chromatography / Mass Spectrometry (GC / MS) comprised fractionation and speciation of hydrocarbons including analysis for benzene, toluene, ethylbenzene and xylenes (BTX) and MTBE compounds. Selected samples were analysed for:

- Heavy metals by IRIS emission spectroscopy.
- Volatile and semi volatile components (including PAHs), by GC/MS.
- Asbestos Containing Materials (ACMs) by Polarised light microscopy / Gravimetry.

The analytical results were analysed for contaminants associated with use of the site as a PFS and generic industrial land use. The results of soil analysis were compared using the following UK guidance:

- LQM/CIEH's Suitable for Use Levels (S4ULs)
- DEFRA Category 4 Screening Levels (C4SLs);
- EIC Soil Generic Assessment Criteria for Human Health (2010).

7.2.1 Soil Testing Results

The results of laboratory analyses on the soil samples undertaken are presented in Appendix E.

Due to the site's proposed redevelopment end use as residential housing, the soil analysis testing results have been compared against 'Residential with plant uptake' end use Generic Assessment Criteria (GACs) thresholds. GAC concentrations associated with a conservative 1% Soil Organic Matter (SOM) have been utilised.

Exceedances of the 'Residential with plant uptake' end use GACs were identified in all made ground soil samples analysed, as outlined in Table 7 below.

Exploratory Hole	Depth m bgl	Contaminant	Concentration Recorded mg/kg	Residential GAC mg/kg
TP01	0.80	Arsenic	122	32
		Lead	513	200
TP02	0.30	Arsenic	48	32
		Lead	420	200
TP04	0.80	Arsenic	35	32
		Lead	620	200
TP05	0.30	Lead	273	200
TP06	0.80	Arsenic	85	32
		Lead	609	200
TP07	0.30	Arsenic	42	32
		Lead	8310	200
		Zinc	8460	3700

Table 7. Recorded Residential GAC Exceedances in Made Ground Soil Samples

The two natural clay soil samples recorded significantly lower concentrations of contaminants, indicating that the rate of vertical migration of arsenic, lead and zinc from made ground soils into the underlying natural strata is low.

7.2.2 Asbestos Fibres in Soil

All eight soil samples were analysed to identify any asbestos fibres present. One made ground soil sample (TP2 at 0.30m bgl) positively identified Chrysotile asbestos fibres, with quantification analysis recording <0.001% ^w/_w.

8.0 Risk Estimation

8.1 Discussion of Investigation Findings

8.1.1 Site Soils

Reflecting the site's use as allotment gardens from the late-19th century, made ground soils with anthropogenic material was encountered up to 2.4m bgl and included possible asbestos cement identified in made ground soils in the northern area of the site.

The Preliminary Risk Assessment (Section 5.0) identified a potential Moderate risk to site end users from contamination within shallow site soils. The shallow investigation and subsequent environmental soil analysis has recorded Residential with plant uptake GAC exceedances with respect to arsenic, lead and zinc in made ground soil samples.

While Chrysotile asbestos fibres were positively identified in TP02, the quantification analysis recorded <0.001% w/w indicating low risk to human health from asbestos fibres in soils.

8.1.2 Controlled Waters

The Preliminary Risk Assessment (Section 5.0) identified a potential Low risk of the site having an adverse impact upon surface water and groundwater receptors respectively, due to the absence of industrial land use on site and low water quality of the neighbouring River Roch (water quality C).

The shallow site investigation undertaken in March 2024 did not identify any groundwater up to a depth of 3.0m bgl (75.99-73-53m AOD). Furthermore, the environmental chemical analysis results reported significantly lower concentrations of contaminants within the underlying natural soils, indicating contamination within the made ground soils is not migrating vertically downwards.

8.1.3 Ground Gases

The Phase 1 PRA report identified a potential Moderate risk to site end users from ground gases arising from alluvium deposits underlying or close to the site.

The investigation recorded Peat deposits in TP01 and TP02 in the southern and southwestern areas of the site, with the remainder of the exploratory holes recording clay with organic or peat pockets or horizons. This organic material could be a potential source of ground gases.

No ground gas monitoring has been undertaken to date.

8.2 Limitations and Uncertainty

It is important to note that the investigation was restricted in areas due to the presence of the historic shed floor slabs road and uneven ground.

Localised areas of deeper made ground cannot be discounted.

8.3 Qualitative Risk Assessment

Each of the identified potential contamination linkages in the preliminary conceptual site model (Section 5.5) is reviewed based upon the findings of the site investigation which allows a greater understanding of the ground conditions at the site, site observations, soil quality and chemical analysis.

The qualitative risk assessment is undertaken, detailed in Table 8 on the following page, in line with guidance provided in CIRIA's Contaminated Land Risk Assessment: a guide to good practice CIRIA C552, 2001. The purpose of this assessment is to determine the relative significance of the identified contamination linkages by assessing the probability of an impact occurring and by assessing the perceived severity of an impact to a receptor.

The perceived risk is based on a consideration of both the likelihood of an event (probability) occurring, and the severity of the potential consequence. Classification of these two factors is detailed in Appendix F.

Those linkages considered of low risk or less on the basis of the available site data will not be considered any further in this assessment. Linkages considered to be more significant are identified as presenting potentially unacceptable risk to the identified receptor. In these instances, further works may be considered necessary.

Source(s)	Pathway(s)	Receptor(s)	Comments	Risk	Requires Further Work
Elevated concentrations of arsenic, lead and zinc above Residential with plant uptake GAC thresholds in made ground soil samples only. Possible asbestos fragments identified in TP05, with Chrysotile asbestos fibres <0.001% w/w recorded in TP02.	Leaching to groundwater, lateral and vertical flow, followed by migration within the aquifer	River Roch located 27m west with river quality C. (controlled waters)	Low permeable superficial deposits but taking into account the proximity of the nearest surface water receptor.	Low (Low Likelihood x Mild)	No
		Alluvium and Coal Measures bedrock are Secondary A Aquifer. Other superficial deposits are Undifferentiated Aquifer. No SPZ or potable water abstraction within 1km (controlled waters)	No groundwater encountered to a depth of 3.0m bgl, with lab analysis of soil samples recording significantly lower concentrations of contaminants within the underlying natural soils	Low (Unlikely x Medium)	No
	Direct contact and ingestion of contaminants and inhalation of asbestos in soils and dust	Proposed residential site end users with private gardens. (human health)	Made ground soils currently present a risk to Residential end users if left at surface level in new gardens	Moderate (Likely x Medium)	Yes
		Construction workers. (human health)	Made ground soils currently present a risk to construction workers, however it is assumed suitable welfare facilities and PPE will be available during groundworks. The presence of fragments of asbestos containing across the surface of the site or within made ground soils cannot be discounted.	Moderate / Low (Low Likelihood x Medium)	Yes

Source(s)	Pathway(s)	Receptor(s)	Comments	Risk	Requires Further Work
Potential for noxious ground gases arising from peat and organic clay deposits identified underlying the site	Inhalation within enclosed spaces	Proposed residential site end users, principally within enclosed areas. (human health)	Encountered organic natural soils and a deep water table indicate these soils may be a source of noxious ground gases.	Moderate (Likely x Medium)	Yes

Table 8. Summary of Qualitative Risk Assessment

9.0 Conclusions and Recommendations

A Phase I / II Contaminated Land Site Assessment of former allotment gardens located on Land off Waterfold Lane, located at Heywood, Bury, BL9 7JY was undertaken, prior to proposed redevelopment of the site for Residential dwellings with private gardens.

The purpose of the assessment was to evaluate the potential for risk to be posed to human health and controlled waters from historical and current use of the site. The investigation recorded a thin topsoil layer over granular made ground to a maximum depth of 2.4m bgl. Underlying the made ground, natural soils representative of alluvium were recorded and included soft to firm organic clay, peat and sand.

Environmental chemical analysis of six made ground soil samples identified elevated concentrations of arsenic, lead and zinc at concentrations that present a risk to residential end users and construction workers. While Chrysotile asbestos fibres were identified at <0.001% w/w, the presence of suspected ACM fragments at surface level or within shallow soils also presents a risk to human health.

Consequently, Geo² consider the risk to residential end users and construction workers from contamination within shallow site soils to be **Moderate** and **Moderate/Low** respectively.

Shallow or perched groundwater was not encountered during the investigation and environmental chemical analysis of soil samples recorded significantly reduced concentrations of contaminants with depth. This is considered by Geo² to indicate that there exists low risk of vertical migration of contamination to controlled waters.

Consequently, Geo² consider the risk to controlled waters from contamination within shallow site soils to be **Low**.

As organic natural soils included peat were identified during the shallow investigation, Geo² considers the risk to residential end users from noxious ground gases to be **Moderate**.

9.1 Recommendations

The following measures are recommended to address the identified risks and to assist in satisfying anticipated contaminated land planning conditions:

9.1.1 Ground Conditions

- A deeper ground investigation will likely be required in order to find suitable ground conditions upon which to place foundations for the proposed dwellings.
- These boreholes would also allow the installation of ground gas monitoring wells, with ground gas monitoring required to allow further assessment of this source-pathway-receptor linkage.

9.1.2 Groundworks

- Suitable welfare facilities and PPE should be provided for all construction workers and standard health & safety procedures adhered to following risk assessments by employers in accordance with Construction Design Management (CDM) Regulations, 2015 and with reference to the environmental testing results included within Appendix E.
- Due to a fragment of suspected asbestos containing material identified during the investigation, it is recommended that contractors undertaking ground works establish suitable risk assessments and undertake picking of asbestos where appropriate. Appropriate asbestos management and disposal measures may also be required, and the advice of an asbestos specialist should be obtained.
- When development works take place on site, a watching brief should be imposed to ensure that any impacts unidentified in the site investigation can be characterised and treated appropriately. Any unidentified contaminated material should be considered in the event of a redevelopment as costs for offsite disposal of these materials may be significant.

9.1.3 Construction

- Due to made ground soils recording elevated concentrations of arsenic, lead and zinc, a clean and inert capping of suitable thickness will be required in all private gardens and areas of soft landscaping.
- Ground gas protection measures, dependant on results of suitable ground gas monitoring over a period of varying atmospheric conditions.

A Remediation Strategy will be required upon completion of the ground gas monitoring, to complete a risk assessment and to outline the gas protection measures (if required) and requirements of the clean and inert capping. This Remediation Strategy would also set out a watching brief for unexpected contamination.

10.0 Report Limitations

This Report was prepared by Geo² for the sole and exclusive use of the Client and for the specific purpose for which Geo² was instructed. Unless explicitly agreed otherwise, in writing, this Report has been prepared under Geo²'s Standard Terms and Conditions.

Geo² does not intend, without its written consent through a formal letter of reliance or warranty, for this Report to be disseminated to any party other than the named Client or to be used or relied upon by any party other than the named Client. Use of the Report by any other party is unauthorised and such use is at the sole risk of the user. Any party using or relying upon this Report, other than the Client, agrees by virtue of its use to indemnify and hold harmless Geo² from and against all claims, losses and damages (of whatsoever nature and howsoever or whensoever arising), arising out of or resulting from the performance of the work by Geo².

The recommendations contained within this Report represent Geo²'s professional opinions, based upon the information detailed within the Report, exercising the reasonable skill and care to be expected of a professional consultant holding itself out as having the competence, experience, and resources necessary for the purpose of carrying out similar work in scope and character to the services performed. The Report needs to be considered in the light of the proposal and associated limitations of scope. The Report needs to be read and considered in full and isolated sections cannot be used without full reference to other elements of the Report and any previous works referenced within the Report.

Appendix B – Photographic Survey

1516A – Waterfold Lane, Heywood – Photographic Survey 1

Image 1: Building 2, timber clad garage on the western boundary of the site, with the vegetated site to its rear. Facing east

Image 2: Image showing the entrance to the site from Waterfold Lane, between two rows of terraced houses. Building 2 is on the right. Facing west.

Image 3: Northwestern area of the site, uneven ground, vegetated with some fly-tipped materials. Facing northwest

Image 4: Northern half of the site, with the northeastern corner shown to slope upwards. Residential house located to the north. Facing north

Image 5: Eastern side of the site, which slopes upwards. Tipped materials can be seen on the slope. Facing east

Image 6: Southeastern area of the site, with the concrete floor slabs of previous sheds still in-situ. Facing southeast.

1516A – Waterfold Lane, Heywood – Photographic Survey 2

Image 7: Floor slabs and glass fragments evident where glass houses have been removed / dismantled.

Image 8: Southern end of the site, with agricultural field seen beyond. Facing south

Image 9: Southwestern corner, overgrown with vegetation and uneven ground. Facing south

Image 10: Southwestern corner of the site, with terraced houses located off-site to the west. Buildings 20 and 21 (Garages) seen. Facing west.

Image 11: March 2024, some vegetation has died back. TP1 located in the southern end of the site. Facing southwest

Image 12: Residue of a bonfire, located in the northern area of the site near TP5

1516A – Waterfold Lane, Heywood – Photographic Survey 3

Image 13: Suspected asbestos fragment in TP5

Image 14:

Image 15: Waterfold Lane with the site to the rear of the houses on the left and the River Roch to the right. Facing south

Image 16: The River Roch located west of the site, facing north

Introduction

The Environment Act 1995 has made site sensitivity a key issue, as the legislation pays as much attention to the pathways by which contamination could spread, and to the vulnerable targets of contamination, as it does the potential sources of contamination. For this reason, Landmark's Site Sensitivity maps and Datasheet(s) place great emphasis on statutory data provided by the Environment Agency/Natural Resources Wales and the Scottish Environment Protection Agency; it also incorporates data from Natural England (and the Scottish and Welsh equivalents) and Local Authorities; and highlights hydrogeological features required by environmental and geotechnical consultants. It does not include any information concerning past uses of land. The datasheet is produced by querying the Landmark database to a distance defined by the client from a site boundary provided by the client. In this datasheet the National Grid References (NGRs) are rounded to the nearest 10m in accordance with Landmark's agreements with a number of Data Suppliers.

Geology 1:50,000 Maps

This report contains geological map extracts taken from the BGS Digital Geological map of Great Britain at 1:50,000 scale and is designed for users carrying out preliminary site assessments who require geological maps for the area around the site. This mapping may be more up to date than previously published paper maps.

The various geological layers - artificial and landslip deposits, superficial geology and solid (bedrock) geology are displayed in separate maps, but superimposed on the final 'Combined Surface Geology' map. All map legends feature on this page. Not all layers have complete nationwide coverage, so availability of data for relevant map sheets is indicated below.

Artificial Ground and Landslip

Artificial ground is a term used by BGS for those areas where the ground surface has been significantly modified by human activity. Information about previously developed ground is especially important, as it is often associated with potentially contaminated material, unpredictable engineering conditions and unstable ground.

Artificial ground includes:

- Made ground - man-made deposits such as embankments and spoil heaps on the natural ground surface.
- Worked ground - areas where the ground has been cut away such as quarries and road cuttings.
- Infilled ground - areas where the ground has been cut away then wholly or partially backfilled.
- Landscaped ground - areas where the surface has been reshaped.
- Disturbed ground - areas of ill-defined shallow or near surface mineral workings where it is impracticable to map made and worked ground separately.

Mass movement (landslip) deposits on BGS geological maps are primarily superficial deposits that have moved down slope under gravity to form landslips. These affect bedrock, other superficial deposits and artificial ground. The dataset also includes foundered strata, where the ground has collapsed due to subsidence.

Superficial Geology

Superficial Deposits are the youngest geological deposits formed during the most recent period of geological time, the Quaternary, which extends back about 1.8 million years from the present.

They rest on older deposits or rocks referred to as Bedrock. This dataset contains Superficial deposits that are of natural origin and 'in place'. Other superficial strata may be held in the Mass Movement dataset where they have been moved, or in the Artificial Ground dataset where they are of man-made origin.

Most of these Superficial deposits are unconsolidated sediments such as gravel, sand, silt and clay, and onshore they form relatively thin, often discontinuous patches or larger spreads.

Bedrock and Faults

Bedrock geology is a term used for the main mass of rocks forming the Earth and are present everywhere, whether exposed at the surface in outcrops or concealed beneath superficial deposits or water.

The bedrock has formed over vast lengths of geological time ranging from ancient and highly altered rocks of the Proterozoic, some 2500 million years ago, or older, up to the relatively young Pliocene, 1.8 million years ago.

The bedrock geology includes many lithologies, often classified into three types based on origin: igneous, metamorphic and sedimentary.

The BGS Faults and Rock Segments dataset includes geological faults (e.g. normal, thrust), and thin beds mapped as lines (e.g. coal seam, gypsum bed). Some of these are linked to other particular 1:50,000 Geology datasets, for example, coal seams are part of the bedrock sequence, most faults and mineral veins primarily affect the bedrock but cut across the strata and post date its deposition.

Combined Surface Geology

The Combined Surface Geology map combines all the previous maps into one combined geological overview of your site.

Please consult the legends to the previous maps to interpret the Combined "Surface Geology" map.

Additional Information

More information on 1:50,000 Geological mapping and explanations of rock classifications can be found on the BGS website. Using the LEX Codes in this report, further descriptions of rock types can be obtained by interrogating the 'BGS Lexicon of Named Rock Units'. This database can be accessed by following the 'Information and Data' link on the BGS website.

Lancashire And Furness

Published 1893

Source map scale - 1:2,500

The historical maps shown were reproduced from maps predominantly held at the scale adopted for England, Wales and Scotland in the 1840's. In 1854 the 1:2,500 scale was adopted for mapping urban areas and by 1896 it covered the whole of what were considered to be the cultivated parts of Great Britain. The published date given below is often some years later than the surveyed date. Before 1938, all OS maps were based on the Cassini Projection, with independent surveys of a single county or group of counties, giving rise to significant inaccuracies in outlying areas.

Large-Scale National Grid Data

Published 1992

Source map scale - 1:1,250

'Large Scale National Grid Data' superseded SIM cards (Ordnance Survey's 'Survey of Information on Microfilm') in 1992, and continued to be produced until 1999. These maps were the fore-runners of digital mapping and so provide detailed information on houses and roads, but tend to show less topographic features such as vegetation. These maps were produced at both 1:2,500 and 1:1,250 scales.

Large-Scale National Grid Data

Published 1996

Source map scale - 1:1,250

'Large Scale National Grid Data' superseded SIM cards (Ordnance Survey's 'Survey of Information on Microfilm') in 1992, and continued to be produced until 1999. These maps were the fore-runners of digital mapping and so provide detailed information on houses and roads, but tend to show less topographic features such as vegetation. These maps were produced at both 1:2,500 and 1:1,250 scales.

The historical maps shown were reproduced from maps predominantly held at the scale adopted for England, Wales and Scotland in the 1840's. In 1854 the 1:2,500 scale was adopted for mapping urban areas; these maps were used to update the 1:10,560 maps. The published date given therefore is often some years later than the surveyed date. Before 1938, all OS maps were based on the Cassini Projection, with independent surveys of a single county or group of counties, giving rise to significant inaccuracies in outlying areas. In the late 1940's, a Provisional Edition was produced, which updated the 1:10,560 mapping from a number of sources. The maps appear unfinished - with all military camps and other strategic sites removed. These maps were initially overprinted with the National Grid. In 1970, the first 1:10,000 maps were produced using the Transverse Mercator Projection. The revision process continued until recently, with new editions appearing every 10 years or so for urban areas.

Manchester

Published 1975

Source map scale - 1:25,000

These maps were produced by the Russian military during the Cold War between 1950 and 1997, and cover 103 towns and cities throughout the U.K. The maps are produced at 1:25,000, 1:10,000 and 1:5,000 scale, and show detailed land use, with colour-coded areas for development, green areas, and non-developed areas. Buildings are coloured black and important building uses (such as hospitals, post offices, factories etc.) are numbered, with a numbered key describing their use.

They were produced by the Russians for the benefit of navigation, as well as strategic military sites and transport hubs, for use if they were to have invaded the U.K. The detailed information provided indicates that the areas were surveyed using land-based personnel, on the ground, in the cities that are mapped.

10k Raster Mapping

Published 1999

Source map scale - 1:10,000

The historical maps shown were produced from the Ordnance Survey's 1:10,000 colour raster mapping. These maps are derived from Landplan which replaced the old 1:10,000 maps originally published in 1970. The data is highly detailed showing buildings, fences and field boundaries as well as all roads, tracks and paths. Road names are also included together with the relevant road number and classification. Boundary information depiction includes county, unitary authority, district, civil parish and constituency.

VectorMap Local

Published 2023

Source map scale - 1:10,000

VectorMap Local (Raster) is Ordnance Survey's highest detailed 'backdrop' mapping product. These maps are produced from OS's VectorMap Local, a simple vector dataset at a nominal scale of 1:10,000, covering the whole of Great Britain, that has been designed for creating graphical mapping. OS VectorMap Local is derived from large-scale information surveyed at 1:1250 scale (covering major towns and cities), 1:2500 scale (smaller towns, villages and developed rural areas), and 1:10 000 scale (mountain, moorland and river estuary areas).

Report Notes

General

This report shall not be reproduced, except in full, without written approval from Envirolab.
 The results reported herein relate only to the material supplied to the laboratory.
 The residue of any samples contained within this report, and any received within the same delivery, will be disposed of **four weeks** after the initial scheduling. For samples tested for Asbestos we will retain a portion of the dried sample for a minimum of **six months** after the initial Asbestos testing is completed.
 Analytical results reflect the quality of the sample at the time of analysis only.
 Opinions and Interpretations expressed are outside our scope of accreditation.
 The client Sample No, Client Sample ID, Depth to top, Depth to Bottom and Date Sampled are all provided by the client.
 A deviating sample report is appended and will indicate if samples or tests have been found to be deviating. Any test results affected may not be an accurate record of the concentration at the time of sampling and, as a result, may be invalid.

Key

Superscript "#"	Accredited to ISO 17025
Superscript "M"	Accredited to MCertS
Superscript "U"	Individual result not accredited
None of the above symbols	Analysis unaccredited
Subscript "A"	Analysis performed on as-received Sample
Subscript "D"	Analysis performed on the dried sample, crushed to pass 2mm sieve.
Subscript "A"	Analysis has dependant options against results. Details appear in the comments of your Sample receipt
IS	Insufficient Sample for analysis
US	Unsuitable Sample for analysis
NDP	No Determination Possible
NAD	No Asbestos Detected
N/A	Not applicable

Asbestos

Asbestos in soil analysis is performed on a dried aliquot of the submitted sample and cannot guarantee to identify asbestos if only present in small numbers as discrete fibres/fragments in the original sample.
 Stones etc. are not removed from the sample prior to analysis
 Quantification of asbestos is a 3 stage process including visual identification, hand picking and weighing, and fibre counting by sedimentation/phase contrast optical microscopy if required. If asbestos is identified as being present but is not in a form that is suitable for analysis by hand picking and weighing (normally if the asbestos is present as free fibres) quantification by sedimentation is performed. Where ACMs are found a percentage asbestos is assigned to each with reference to 'HSG264, Asbestos: The survey guide' and the calculated asbestos content is expressed as a percentage of the dried soil sample aliquot used.

Assigned Matrix Codes

1	SAND	6	CLAY/LOAM	A	Contains Stones
2	LOAM	7	OTHER	B	Contains Construction Rubble
3	CLAY	8	Asbestos Bulk (Only Asbestos ID accredited)	C	Contains visible hydrocarbons
4	LOAM/SAND	9	Incinerator Ash (some Metals accredited)	D	Contains glass / metal
5	SAND/CLAY			E	Contains roots / twigs

Note: 7,8,9 matrices are not covered by our ISO 17025 or MCertS accreditation, unless stated above.

Soil Chemical Analysis:

All results are reported as dry weight (<40°C).
 For samples with Matrix Codes 1 - 6 natural stones, brick and concrete fragments >10mm and any extraneous material (visible glass, metal or twigs) are removed and excluded from the sample prior to analysis and reported results corrected to a whole sample basis. This is reported as '% stones >10mm'.
 For samples with Matrix Code 7 the whole sample is dried and crushed prior to analysis and this supersedes any "A" subscripts
 All analysis is performed on the sample as received for soil samples which are positive for asbestos or the client has informed asbestos may be present and/or if they are from outside the European Union and this supersedes any "D" subscripts.

TPH by method A-T-007:

For waters, free and visible oils are excluded from the sample used for analysis, so the reported result represents the dissolved phase only.
 Results "with Clean up" indicates samples cleaned up with Silica during extraction.

EPH CWG (method A-T-055) from TPH CWG:

EPH CWG results have humics mathematically subtracted through instrument calculation.
 Where these humic substances have been identified in any IDs from "TPH CWG with clean up" please note that the concentration is **NOT** included in the quantified results but present in the ID for information.

Electrical Conductivity of water by method A-T-037:

Results greater than 12900µS/cm @ 25°C / 11550µS/cm @ 20°C fall outside the accreditation range and as such are unaccredited.

Please contact your client manager if you require any further information.

Envirolab Deviating Samples Report

Hattersley Science & Technology Park, Stockport Road, Hattersley, SK14 3QU
Tel. 0161 368 4921 email. ask@envlab.co.uk

Client: Geo2 Remediation Ltd, Coniston House,, Louisa Street, Bradford, BD10 8NE

Project No: 24/03151

Project: Waterfold (WF)

Date Received: 27/03/2024 (am)

Clients Project No: 1516

Cool Box Temperatures (°C): 13.7

NO DEVIATIONS IDENTIFIED with respect to sampling dates or containers received.

Note: If, at any point before reaching the laboratory, the temperature of the samples has breached those set in published standards, e.g. BS-EN 5667-3 (for water samples $5 \pm 3^{\circ}\text{C}$), ISO 18400-105:2017, then the concentration of any affected analytes may differ from that at the time of sampling.

End of Report

Appendix F – Risk Assessment Terminology

Definitions and Classifications of Risk Assessment Terminology.

Probability

Probability can be defined as the chance of a particular event occurring in a given period of time.

Descriptions of each of the four qualitative terms to be use in this report to describe the perceived probability of any identified pollutant linkage becoming realised are shown below in Table W.

Term	Description
High Likelihood	There is pollutant linkage and an event would appear very likely in the short-term and almost inevitable over the long-term, or there is evidence at the receptor of harm or pollution.
Likely	There is pollutant linkage and all the elements are present and in the right place which means that it is probable that an event will occur. Circumstances are such that an event is not inevitable, but possible in the short-term and likely over the long-term.
Low Likelihood	There is pollutant linkage and circumstances are possible under which an event could occur. However, it is by no means certain that even over a long period such an event would take place, and is less likely in the shorter term.
Unlikely	There is pollutant linkage but circumstances are such that it is improbable that an event would occur even in the very long-term.

Table W. Description of Probability Classifications

Severity

Severity (consequence) can be defined as the adverse effects (or harm) arising from a defined hazard, which impairs the quality of human health or the environment in the short or longer term.

Descriptions of each of the four qualitative terms to be use in this report to describe the perceived potential severity of any identified pollutant linkage becoming realised are shown below in Table X.

Term	Description
Severe	Highly elevated concentrations likely to result in “significant harm” to human health as defined by the EPA 1990, Part 2A, if exposure occurs. Equivalent to EA Category 1 pollution incident including persistent and/or extensive effects on water quality; leading to closure of a potable abstraction point; major impact on amenity value or major damage to agriculture or commerce. Major damage to aquatic or other ecosystems, which is likely to result in a substantial adverse change in its functioning or harm to a species of special interest that endangers the long-term maintenance of the population. Catastrophic damage to crops, buildings or property.
Medium	Elevated concentrations which could result in “significant harm” to human health as defined by the EPA 1990, Part 2A if exposure occurs. Equivalent to EA Category 2 pollution incident including significant effect on water quality; notification required to abstractors; reduction in amenity value or significant damage to agriculture or commerce. Significant damage to aquatic or other ecosystems, which may result in a substantial adverse change in its functioning or harm to a species of special interest that may endanger the long-term maintenance of the population. Significant damage to crops, buildings or property.
Mild	Exposure to human health unlikely to lead to “significant harm”. Equivalent to EA Category 3 pollution incident including minimal or short-lived effect on water quality; marginal effect on amenity value, agriculture or commerce. Minor or short-lived damage to aquatic or other ecosystems, which is unlikely to result in a substantial adverse change in its functioning or harm to a species of special interest that would endanger the long-term maintenance of the population. Minor damage to crops, buildings or property.
Minor	No measurable effect on humans. Equivalent to insubstantial pollution incident with no observed effect on water quality or ecosystems. Repairable effects of damage to buildings, structures and services.

Table X. Description of Severity Classifications

Once the severity and probability of a pollutant linkage has been determined the risk can be assessed using the risk matrix shown overleaf on Table Y.

Risk Matrix

By cross referencing the derived severity and probability in Table Y, below the perceived potential risk can be determined.

		Severity			
		Severe	Medium	Mild	Minor
Probability	High Likelihood	Very High Risk	High Risk	Moderate Risk	Moderate / Low Risk
	Likely	High Risk	Moderate Risk	Moderate / Low Risk	Low Risk
	Low Likelihood	Moderate Risk	Moderate / Low Risk	Low Risk	Very Low Risk
	Unlikely	Moderate / Low Risk	Low Risk	Very Low Risk	Very Low Risk

Table Y. Risk Assessment Matrix

The risk categories detailed above are defined below in the following Table Z.

Term	Description
Very High Risk	There is a high probability that significant harm could arise to a designated receptor from an identified hazard at the site without appropriate remedial action.
High Risk	Significant harm is likely to arise to a designated receptor from an identified hazard at the site without appropriate remedial action.
Moderate Risk	It is possible that without appropriate remedial action, harm could arise to a designated receptor but it is relatively unlikely that any such harm would be severe and if any harm were to occur, it is likely that such harm would be relatively mild.
Low Risk	It is possible that significant harm could arise to a designated receptor from an identified hazard but it is likely that at worst this harm if realised would normally be mild.
Very Low Risk	There is a low possibility that harm could arise to a receptor. In the event of such harm being realised, it is not likely to be severe.

Table Z. Definition of Risk
