

The site is being used as informal car park by members of the public and staff using the hospital. It is covered with loose stone / tarmac plannings.

Proposal

The works include formalising of the car parking to create a permeant hardstanding carpark.

This will include the removal of the loose surface to the area and the installation of a new hard surface. Minor alterations to the existing small retaining wall will take place the improve access.

This will include the laying of a tarmacdam base as part of the works line marking will be undertaken which will include provision for a minimum of three accessible parking space.

This will then enable a solid surface to be provided to enable access into the hospital buildings via the existing footpaths around the main hospital site.
