1.0 Introduction

Geo² Remediation Limited were commissioned by Alexander Duckham & Co., Ltd to conduct a Phase I Preliminary Risk Assessment of a parcel of land located at

Ceylon Service Station,

Yorkshire Street,
Rochdale,
OL16 2DR

The site is approximately 0.08 hectares in area and located at grid reference 390250, 413900.

The study was undertaken prior to the proposed redevelopment of the site for continued use as a petrol filling station (PFS). A proposed redevelopment plan for the site can be referred to within Appendix A.

1.1 Scope of Works

The Phase I Preliminary Risk Assessment, consisting of a desk study, was conducted in order to establish evidence of potential contamination, if any, resulting from the past use of the site and current land use.

The desk study was also undertaken to identify possible sensitive receptors that may be at risk within the locality of the site.

2.0 Description of the Site and Surroundings

2.1 Site Description

The site is located 1 km northeast of the centre of the town of Rochdale. Figures 1 and 2 in Appendix A show the location of the site.

The site is currently an active Shell PFS. The canopy-covered forecourt resides in the centre-west with three pump islands. The shop is located on the western boundary and a hand car wash, with its own building, is located on the southern boundary.

The area shown within the red site boundary on Figure A, below, will be referred to throughout this document as 'the site'.

The site is located on Yorkshire Street (A58) and is currently accessed by two ingress/egress points located at the north-western and north-eastern site corners.

Figure A: Site Location Plan. Red is approximate site boundary and orange are the 50 and 100 m buffers. Extract from Envirocheck report (Appendix B).

2.2 Site Surroundings

The site is located in the Metropolitan County of Greater Manchester. The nearest residential properties are located 10 m north and east. The surrounding land uses of the site are summarised in Table 1 below.

Direction	Land Use
North	Yorkshire Street (A58) with residential properties beyond
East	Flannel Street with residential properties beyond
South	Back Bradshaw Street with a judo club beyond
West	East Street with a restaurant beyond

Table 1. Land Uses in the Surrounding Area.

2.3 Site Infrastructure

2.3.1 Surfacing

Based on Google Maps, the site is surfaced with concrete slabs, judged to be in fair to poor condition. Gullies line the site boundaries.

2.3.2 Fuel Storage Infrastructure

The information, number, location, and status of any UST or AST was not provided to Geo² at the time of writing this report. The location of the interceptor is unknown.

2.4 Proposed Redevelopment

A proposed redevelopment plan is provided in Appendix A.

The redevelopment plan proposes demolition of the existing shop and hand car wash structure. The new shop will be located on the western boundary and will extend towards the southern boundary of the site.

The canopy, pump islands, and underground storage tanks (UST) will remain in their previous positions, with the pump islands replaced. New vents will be placed on the southern boundary.

3.0 Desk Study

3.1 Desk Study Data

Information regarding the environmental setting of the site was obtained from the Envirocheck report, which collated information from a variety of sources. A copy of the Envirocheck report is presented in Appendix B.

Where indicated in Table 3 and Table 4 below, the data from the Envirocheck report has been supplemented with additional information obtained from freely available online data.

Site Geology	BGS data indicates bedrock consists of Old Lawrence Rock – sandstone. Superficial deposits are indicated to comprise glaciofluvial deposits, Devensian – sand and gravel. Available BGS borehole logs within 1 km of the site have recorded • loose clayey sandy silt to depths of 2.2 m bgl overlaying firm to stiff sandy clay (ref.: SD91SW197) • made ground to 3.5 m bgl overlaying soft to firm silty clay with slight gravels (ref.: SD91SW112). There are three BGS Recorded Mineral Sites within 1 km of the site. The nearest was 92 m south and is a now-ceased opencast sand quarry. The site has no to very low hazard regarding the potential for ground stability hazards including collapsible ground, compressible ground, ground dissolution, landslide, running sand and shrinking and swelling clays.
Coal	A review of the Coal Authority online interactive mapping indicates that while the site is located within a coal mining reporting area, the site is not located within a Development High Risk Area (DHRA) and the nearest recorded mine shafts, coal outcrops and probable shallow coal mine workings are all located >500 m east.
Radon	The site is in a low probability radon area (less than 1% of homes are estimated to be at or above the Action Level). As such, no radon protective measures are necessary in the construction of new dwellings or extensions.
Site Hydrogeology	The bedrock is classified as a Secondary A Aquifer – permeable layers capable of supporting water supplies at a local rather than strategic scale, and in some cases forming an important source of base flow to rivers. These are generally aquifers formerly classified as minor aquifers. The superficial deposits are a Secondary A Aquifer. The site is not located within a Source Protection Zone (SPZ). The nearest groundwater abstraction point was located 435 m east and was operated by Holcroft Castings & Forgings Ltd. The licence is now revoked. The groundwater beneath the site in the combined productive bedrock and productive superficial aquifers has been classed as high vulnerability.

Table 3. Environmental Assessment of the Site.

Site Hydrology	The nearest surface water feature is the Hey Brook stream located 217 m northeast, flowing southeast. The River Roch is located 213 m south, flowing southeast and has a Grade C water quality. The Hey Brook is located 295 m east, flowing west and has a Grade A water quality. There are two recorded pollution incidents within 250 m of the site. The nearest was 163 m northeast and relates to diesel spillage into the Roch Catchment. The severity is listed as category 3 – minor incident. There are four discharge consents within 250 m of the site. The nearest was 213 m northeast and related to public sewage into a freshwater stream. The authorisation is now revoked.
Waste and Infilled Land	There is one BGS recorded landfill site located 466 m southeast: the Waithlands Tip. There are seven historical landfill sites within 1 km of the site. The nearest is 330 m northwest: Carrex Metals Limited. The waste type and last input date are not supplied. There are 21 licenced waste management facilities within 1 km of the site. The nearest is 94 m north and is operated by CAR.I.P Limited who deal with end-of-life vehicles. There are nine records of potentially infilled land (non-water) within 1 km of the site. The nearest is 86 m southeast and may relate to an infilled sand pit. There are 39 records of potentially infilled land (water) within 1 km of the site. The nearest is 199 m north and may relate to the partial infilling of Foxholes Brook.
Unexploded Ordnance	A review of Zetica online risk mapping for the area indicates the site is located in a Low risk area with respect to unexploded ordnance.

Table 4. Environmental Assessment of the Site.

4.0 Site History

Details regarding the development of the site, its immediate surroundings and potentially contaminative land uses were obtained from a review of historical maps.

Copies of the maps are provided in Appendix B and a brief summary is provided in Table 4 with a more detailed summary provided in Table 5, 6, and 7.

Key Historical Activities	
On-Site	The site initially contains four structures, presumably residential dwellings, up until the 1910s when a warehouse appeared onsite. In the 1930s, the warehouse is replaced with a cinema and hall, up until the 1970s when a garage appeared onsite. The current day PFS configuration was established circa 1980s.
Off-Site	Principally urbanised with residential dwellings surrounding the site. Numerous works, and mills began appearing from the 1890s, suggesting the site is situated in an industrial area. A sand pit becomes infilled in the 1980s. Garages and works appear 90 m north up until the 1990s.

Table 4. Brief Summary of Historical Land Use On-Site and Off-Site.

All distances given in Tables 5 and 6 below are approximate and are relative to the site, unless otherwise stated.

Date	On-Site	Off-Site	Potential Contamination
1851 1:1,056 1:10,000	The site contains four structures which cover the entire site.	The site is situated in a developed area, with residential dwellings surrounding the site. The west is largely populated with buildings, while the east from about 100 m is relatively undeveloped. Yorkshire Street has already been established along the northern boundary. A sand pit is located about 80 m southeast.	N/A
1893 1:2,500	The 1:2,500 scale mapping shows three building structures in the northwest corner of the site.	Significant urbanisation occurs from 100 m south, west, and southeast. A tramway runs along Yorkshire Street. A railway is located 100 m northeast of the site. A leather works is located 120 m southeast. Mills , a depot, and an iron foundry are located about 220 m northwest. Another mill is located 220 m southeast. The sand pit is no longer labelled.	Potential for contamination associated with the mill, works, and foundry to migrate towards the site. Potential for backfilled sand pit to be a source of hazardous ground gas.

Table 5. Detailed Summary Review of Historical Mapping (1851–1893)

Date	On-Site	Off-Site	Potential Contamination
1910	The three building structures are labelled a warehouse . The warehouse is a new L-shaped building which encompasses the east and southern boundaries.	Urban expansion continues from 100 m east. A burial ground is located 100 m southwest. The mill located 220 m southeast is labelled as a cotton mill. Another cotton mill is located 250 m west. Providence Works is located about 130 m northwest. The leather works 120 m southeast disappears and appears to be replaced by residential homes.	Potential for hazardous gases such as methane to migrate from the burial ground. Potential for contamination associated with the works and mills to migrate towards the site.
1930	The warehouse is replaced with a cinema and hall.	At this time, the site is predominantly surrounded by residential dwellings. The cotton mill 220 m southeast is now a cotton waste mill. The Providence Works located 130 m northwest is now disused.	N/A
1958 – 1961	No change.	A builder's yard appears directly west of the site. The disused Providence Works located 130 m northwest is now labelled as works. Three works appear 150 m west. The cotton mill 220 m southeast is now a works. The railway and associated Wardleworth Station are disused.	Potential for contamination from deposition of waste materials from the builder's yard. Potential for contamination associated with the works and mills to migrate towards the site.
1971 – 1978	The cinema and hall have been demolished. A garage appears with a building occupying the southern portion of the site.	An engineering works appears 80 m north, with more works 100 m north. A depot is also 100 m north. A plastic works appears 100 m southwest. The three works 150 m west are relabelled/replaced with a warehouse, foundry, and engineering works. A builder's yard and a tank appear 200 m southwest. Two engineering works appears 250 m southwest. An electrical substation appears 110 m northeast. A scrapyard appears 150 north.	Potential for hydrocarbon leaks and spills associated with garage to contaminate the site. Potential for contamination from construction and demolition waste. Potential for contamination associated with the works, mills, and tank to migrate towards the site.

Table 6. Detailed Summary Review of Historical Mapping (1910 – 1978)

Date	On-Site	Off-Site	Potential Contamination
1985 – 1992	The garage building occupying the southern portion of the site is demolished and replaced with three new structures in the centre, east, and south. These structures resemble the current day configuration of the site.	Three garages appear 90 m northeast. Numerous works , depots, and warehouses appear from 200 m west and northwest. A garage appears 175 m northeast. Numerous garages and works appear between 200 and 300 m southeast. A garage appears about 250 m south.	Potential for hydrocarbon leaks and spills associated with garage to contaminate the site. Potential for contamination from construction and demolition waste. Potential for contamination associated with the works, mills, and tank to migrate towards the site.
1999 – 2006 1:10,000	No change.	The works and depot 100 m north are no longer labelled.	N/A
2021 1:10,000	No change.	No works, garages, mills, or depots are labelled within 1 km of the site. A recycling site is located 520 m north.	N/A

Table 6. Detailed Summary Review of Historical Mapping (1985 – 2021)

4.1 Discussion

The site initially contains four unnamed structures, presumably residential dwellings, up until 1910 when a warehouse appeared onsite. The warehouse was then replaced by a cinema and hall up until the 1970s when a garage appeared.

Made ground associated with the construction and demolition of buildings in the southern portion of the site, in addition to the current operation of the site as a PFS are the main potential sources of contamination.

The site is located in an industrial region, with numerous works, garages, warehouses, depots, and mills being located from at least 80 m. Potential contamination associated with industrial units could migrate towards the site, though the 2021 1:10,000 scale mapping showed no evidence of industrial units currently being present near the site.

It is unknown whether the builder's yard that appeared directly west of the site contained a tank.

The 2022 Google Maps satellite imagery shows a metal scrap yard and an auto-repair garage 80–100 m north of the site but no other works could be identified.

5.0 Preliminary Risk Assessment

5.1 Source – Pathway – Receptor

UK legislation and guidance on assessing potentially contaminated land recommends the use of a risk assessment process based on a review of source/pathway/receptor relationships for various environmental media. The first stage of any risk assessment is to identify, using the desk study data and site information, the presence and extent of any hazard at the site, theoretical or demonstrable.

A key component of the overall risk assessment process is identification of “significant contaminant linkages” between contaminants and receptors. This can be accomplished through development of a site-specific conceptual model in which the potential contaminants, pathways and receptors identified on-site are described.

Each element can be defined as follows:

- **Contaminant source:** A substance either on or under the land and which has the potential to cause harm or pollution to human or environmental receptors.
- **Pathway:** A route or means by which a receptor can be exposed to or affected by a source.
- **Receptor:** A living organism or an ecological system, or controlled water, or property including buildings, crops, and livestock.

The presence of all three of the above elements identifies a contamination linkage and a potentially unacceptable risk. To ensure that any risk present to, or, from the site can be appropriately managed each of these contamination linkages will be targeted by the investigation.

5.2 Hazard Identification

Potentially contaminative onsite activities relate to the historical use of the site as a garage from the 1970s and a PFS from the 1980s. Contamination sources may exist related to Made Ground soils on site and the presence of underground storage tanks (USTs).

Due to the age of the buildings on site, it is likely that asbestos materials were used in the construction of the building, leading to the potential for asbestos in shallow made ground soils. While construction and demolition waste were identified as a potential historical source of contamination, the current active status of the site suggests this waste is unlikely to be an issue.

As the site is situated in a historically industrial area, numerous offsite contaminative sources have been identified, particularly the garages, foundries, and works all historically located within 250 m of the site in addition to an active auto-repair garage and metal scrap yard 100 m north.

5.3 Initial Conceptual Site Model

All contamination linkages arising as a result of the interconnection of the contaminant source, contamination pathways and potential receptors are summarised in Table 8 on the following page. These contamination linkages are used to design the site investigation, guiding the type of investigation, location of exploratory boreholes and the required sample analysis.

Linkage No.	Source	Pathway	Receptor
1	Potential contamination (e.g., hydrocarbons) associated with the historical operation as a garage and current operation of the site as a PFS. No asbestos register has been obtained; the pre-2000 development of the site makes asbestos presence in building fabrics or made ground possible.	Leaching to groundwater, lateral and vertical flow, followed by migration within the aquifer	Surface water such as the Hey Brook stream, 217 m northeast flowing southeast
2			Bedrock Secondary A Aquifer Superficial deposits Secondary A Aquifer No SPZ or potable abstraction points within 500 m
3		Exposure to harmful vapours, hazardous ground gas and tainting of water supply	Current and proposed commercial site end users
4			Neighbouring site users, principally within enclosed spaces
5		Direct contact, inhalation, and ingestion	Current and proposed commercial site end users, principally within landscaped area
6	Historical works, garages, foundries, and mills within 250 m of the site Active garage and scrap yard 100 m north	Exposure to harmful vapours, and hazardous ground gas	Current and proposed commercial site end users

Table 8. Identified Initial Contamination Linkages

6.0 Risk Estimation

The objective of the qualitative risk assessment is to determine the significance of the risk, if any, which may occur as a result of the creation of pollutant linkages, which connect a potential receptor to an identified potential contaminant source at the site.

The perceived risk is based on a consideration of both the likelihood of an event (probability) occurring, and the severity of the potential consequence. Classification of these two factors is detailed in Appendix C.

6.1 Qualitative Risk Assessment

A qualitative risk assessment is undertaken, detailed in Table 9 on the following page, in line with guidance provided in CIRIA's Contaminated Land Risk Assessment: a guide to good practice CIRIA C552, 2001. The purpose of this assessment is to determine the relative significance of the identified contamination linkages by assessing the probability of an impact occurring and by assessing the perceived severity of an impact to a receptor.

Those linkages considered of low risk or less on the basis of the available site data will not be considered any further in this assessment. Linkages considered to be more significant are identified as presenting potentially unacceptable risk to the identified receptor. In these instances, further works may be considered necessary.

Linkage No.	Source	Pathway	Receptor	Probability	Severity	Risk Classification
1	Potential contamination (e.g., hydrocarbons) associated with the historical operation as a garage and current operation of the site as a PFS. No asbestos register has been obtained; the pre-2000 development of the site makes asbestos presence in building fabrics or made ground possible.	Leaching to groundwater, lateral and vertical flow, followed by migration within the aquifer	Surface water such as the Hey Brook stream, 217 m northeast flowing southeast	Low Likelihood Considering the relatively far distance to the nearest surface water receptors	Medium	Moderate/Low
2			Bedrock Secondary A Aquifer Superficial deposits Secondary A Aquifer No SPZ or abstraction points within 500 m	Likely Considering the high vulnerability of the underlying aquifers and the high permeability of the indicated superficial deposits of sand and gravel	Medium	Moderate
3		Exposure to harmful vapours, hazardous ground gas and tainting of water supply	Current and proposed Commercial site end users	Likely Contamination may be possible from the USTs, with the condition of the tanks currently unknown	Medium	Moderate
4			Neighbouring site users, principally within enclosed spaces	Likely The nearest residential properties are <25 m north and southeast	Medium	Moderate
5		Direct contact, inhalation, and ingestion	Current and proposed Commercial site end users, principally within landscaped area	Unlikely Though there were active historical industrial land uses surrounding the site, there is no indication of a soft landscaped area in the proposed redevelopment plan. The current site plan contains small areas of hedges which line the boundary of the site	Medium	Low
6	Historical works, garages, foundries, and mills within 250 m of the site Active garage and scrap yard 100 m north	Exposure to harmful vapours, and hazardous ground gas	Current and proposed commercial site end users	Low Likelihood While the site was surrounded by industrial units, most of these units were located at least 80 m away.	Medium	Moderate/Low

Table 9. Summary of Qualitative Risk Assessment

7.0 Conclusions and Recommendations

7.1 Conclusions

A Phase I Preliminary Risk Assessment of the site, located on Ceylon Service Station, Yorkshire Street, Rochdale, OL16 2DR was undertaken, prior to proposed redevelopment of the existing petrol filling station, with a new shop proposed.

The purpose of the assessment was to evaluate the potential for risk to be posed to human health and sensitive environmental receptors from historical and current use of the site.

The historical and current activities as a garage and petrol filling station, respectively, with known USTs may have resulted in the site containing a variable thickness of made ground that may contain harmful materials (e.g., ACMs). No known leaks from the tanks have been made known to Geo² at the time of writing this report.

The numerous industrial works, foundries, and garages which appeared as close as 80 m north of the site pose potential risks of contamination migrating onsite.

The underlying glaciofluvial deposits (sand and gravel), Old Lawrence sandstone bedrock, and the vulnerable Secondary A Aquifers indicate a potential risk to groundwater receptors.

As such, Geo² considers there is a Moderate risk to human health receptors and a Moderate risk to environmental receptors.

7.2 Recommendations

The following measures are recommended to address the identified risks:

- In order to ensure that there is no evidence of significant contamination to the underlying aquifer from contamination that could potentially have migrated vertically and/or horizontally from fuel storage or distribution infrastructure, it is recommended that a site-wide ground investigation is undertaken to investigate shallow soils and groundwater for the potential presence of contamination.

8.0 Limitations

Geo²s' conclusions, recommendations and opinions are based on information gathered at the time of the investigation from a variety of third party sources and from observations made during site reconnaissance. Therefore, there may be conditions at the site that have not been taken into account which were not apparent at the time of investigation.

A portion of this report is based solely upon information provided by third parties. The information has not been independently verified by Geo². Whilst this report and the opinions given in it are accurate to the best knowledge of Geo², Geo² cannot guarantee the completeness or accuracy of any descriptions, opinions or conclusions based solely upon information that has not been independently verified.

The recommendations contained within this report represent our professional opinions. These opinions were arrived at in accordance with currently accepted industry practices and hydrological and engineering practices at this time. As such they are not a guarantee that the site is free of hazardous materials or conditions.

Introduction

The Environment Act 1995 has made site sensitivity a key issue, as the legislation pays as much attention to the pathways by which contamination could spread, and to the vulnerable targets of contamination, as it does the potential sources of contamination. For this reason, Landmark's Site Sensitivity maps and Datasheet(s) place great emphasis on statutory data provided by the Environment Agency/Natural Resources Wales and the Scottish Environment Protection Agency; it also incorporates data from Natural England (and the Scottish and Welsh equivalents) and Local Authorities; and highlights hydrogeological features required by environmental and geotechnical consultants. It does not include any information concerning past uses of land. The datasheet is produced by querying the Landmark database to a distance defined by the client from a site boundary provided by the client. In this datasheet the National Grid References (NGRs) are rounded to the nearest 10m in accordance with Landmark's agreements with a number of Data Suppliers.

Lancashire And Furness

Published 1851

Source map scale - 1:1,056

The 1:1056 scale of Ordnance Survey mapping was adopted from Ireland in 1848 and was used to survey towns with a population of over 4000, plus county towns of lesser population, in those counties mapped at the six-inch scale in 1841-55. The scale was the largest scale at which London was mapped by the Ordnance Survey and a 'skeleton' survey of the capital, showing little more than streets, street names, frontages and altitudes, was undertaken between 1848 and 1850. The majority of the 1:1056 surveys were later replaced by 1:500 surveys; although almost all the remainder were revised at this scale, sometimes more than once before 1895. The type of detail shown on the 1:1056 scale is broadly similar to that on 1:500; the apparent omission of minor details such as sewer access points and street lights may be as much a reflection of the generally earlier date of these plans, as of the specification of the map.

Please note: Due to the partial coverage of Historical Town Plans, it is possible that not all segments within an order will contain mapping. Only the segments that have Town Plan coverage will be generated.

Lancashire And Furness

Published 1891 - 1892

Source map scale - 1:500

The 1:500 scale Ordnance Survey mapping was introduced in 1855 as a replacement for the 1:528 scale and to complement the 1:2500 scale that had been implemented in 1853. By 1895, the 1:500 scale covered most towns over a population of about 4000 at the time of survey, although very few towns were mapped more than once at this scale, and none have been since 1910. The 1:500 scale gives particular emphasis to such features as lamp posts, man holes, arched passages and minor building projections. Also often featured are divisions between tenements, interior ground floor layouts of public buildings, and on earlier plans, the functions of the various parts of larger industrial premises are also indicated. Content of the plans does vary however, from one town to the next in terms of, for example, the completeness of railway tracks and the coverage of public buildings.

Please note: Due to the partial coverage of Historical Town Plans, it is possible that not all segments within an order will contain mapping. Only the segments that have Town Plan coverage will be generated.

Lancashire And Furness

Published 1893

Source map scale - 1:2,500

The historical maps shown were reproduced from maps predominantly held at the scale adopted for England, Wales and Scotland in the 1840's. In 1854 the 1:2,500 scale was adopted for mapping urban areas and by 1896 it covered the whole of what were considered to be the cultivated parts of Great Britain. The published date given below is often some years later than the surveyed date. Before 1938, all OS maps were based on the Cassini Projection, with independent surveys of a single county or group of counties, giving rise to significant inaccuracies in outlying areas.

Ordnance Survey Plan

Published 1959 - 1961

Source map scale - 1:2,500

The historical maps shown were reproduced from maps predominantly held at the scale adopted for England, Wales and Scotland in the 1840's. In 1854 the 1:2,500 scale was adopted for mapping urban areas and by 1896 it covered the whole of what were considered to be the cultivated parts of Great Britain. The published date given below is often some years later than the surveyed date. Before 1938, all OS maps were based on the Cassini Projection, with independent surveys of a single county or group of counties, giving rise to significant inaccuracies in outlying areas.

Supply of Unpublished Survey Information

Published 1974 - 1975

Source map scale - 1:1,250

SUSI maps (Supply of Unpublished Survey Information) were produced between 1972 and 1977, mainly for internal use at Ordnance Survey. These were more of a 'work-in-progress' plan as they showed updates of individual areas on a map. These maps were unpublished, and they do not represent a single moment in time. They were produced at both 1:2,500 and 1:1,250 scales.

Large-Scale National Grid Data

Published 1992

Source map scale - 1:1,250

'Large Scale National Grid Data' superseded SIM cards (Ordnance Survey's 'Survey of Information on Microfilm') in 1992, and continued to be produced until 1999. These maps were the fore-runners of digital mapping and so provide detailed information on houses and roads, but tend to show less topographic features such as vegetation. These maps were produced at both 1:2,500 and 1:1,250 scales.

Lancashire And Furness

Published 1851

Source map scale - 1:10,560

The historical maps shown were reproduced from maps predominantly held at the scale adopted for England, Wales and Scotland in the 1840's. In 1854 the 1:2,500 scale was adopted for mapping urban areas; these maps were used to update the 1:10,560 maps. The published date given therefore is often some years later than the surveyed date. Before 1938, all OS maps were based on the Cassini Projection, with independent surveys of a single county or group of counties, giving rise to significant inaccuracies in outlying areas. In the late 1940's, a Provisional Edition was produced, which updated the 1:10,560 mapping from a number of sources. The maps appear unfinished - with all military camps and other strategic sites removed. These maps were initially overprinted with the National Grid. In 1970, the first 1:10,000 maps were produced using the Transverse Mercator Projection. The revision process continued until recently, with new editions appearing every 10 years or so for urban areas.

LANDMARK INFORMATION GROUP®

Manchester

Published 1975

Source map scale - 1:25,000

These maps were produced by the Russian military during the Cold War between 1950 and 1997, and cover 103 towns and cities throughout the U.K. The maps are produced at 1:25,000, 1:10,000 and 1:5,000 scale, and show detailed land use, with colour-coded areas for development, green areas, and non-developed areas. Buildings are coloured black and important building uses (such as hospitals, post offices, factories etc.) are numbered, with a numbered key describing their use. They were produced by the Russians for the benefit of navigation, as well as strategic military sites and transport hubs, for use if they were to have invaded the U.K. The detailed information provided indicates that the areas were surveyed using land-based personnel, on the ground, in the cities that are mapped.

VectorMap Local

Published 2021

Source map scale - 1:10,000

VectorMap Local (Raster) is Ordnance Survey's highest detailed 'backdrop' mapping product. These maps are produced from OS's VectorMap Local, a simple vector dataset at a nominal scale of 1:10,000, covering the whole of Great Britain, that has been designed for creating graphical mapping. OS VectorMap Local is derived from large-scale information surveyed at 1:1250 scale (covering major towns and cities), 1:2500 scale (smaller towns, villages and developed rural areas), and 1:10 000 scale (mountain, moorland and river estuary areas).

Appendix C – Risk Assessment Terminology

Definitions and Classifications of Risk Assessment Terminology.

Probability

Probability can be defined as the chance of a particular event occurring in a given period of time.

Descriptions of each of the four qualitative terms to be used in this report to describe the perceived probability of any identified pollutant linkage becoming realised are shown below in Table W.

Term	Description
High Likelihood	There is pollutant linkage and an event would appear very likely in the short-term and almost inevitable over the long-term, or there is evidence at the receptor of harm or pollution.
Likely	There is pollutant linkage and all the elements are present and in the right place which means that it is probable that an event will occur. Circumstances are such that an event is not inevitable, but possible in the short-term and likely over the long-term.
Low Likelihood	There is pollutant linkage and circumstances are possible under which an event could occur. However, it is by no means certain that even over a long period such an event would take place, and is less likely in the shorter term.
Unlikely	There is pollutant linkage but circumstances are such that it is improbable that an event would occur even in the very long-term.

Table W. Description of Probability Classifications

Severity

Severity (consequence) can be defined as the adverse effects (or harm) arising from a defined hazard, which impairs the quality of human health or the environment in the short or longer term.

Descriptions of each of the four qualitative terms to be used in this report to describe the perceived potential severity of any identified pollutant linkage becoming realised are shown below in Table X.

Term	Description
Severe	Highly elevated concentrations likely to result in "significant harm" to human health as defined by the EPA 1990, Part 2A, if exposure occurs. Equivalent to EA Category 1 pollution incident including persistent and/or extensive effects on water quality; leading to closure of a potable abstraction point; major impact on amenity value or major damage to agriculture or commerce. Major damage to aquatic or other ecosystems, which is likely to result in a substantial adverse change in its functioning or harm to a species of special interest that endangers the long-term maintenance of the population. Catastrophic damage to crops, buildings or property.
Medium	Elevated concentrations which could result in "significant harm" to human health as defined by the EPA 1990, Part 2A if exposure occurs. Equivalent to EA Category 2 pollution incident including significant effect on water quality; notification required to abstractors; reduction in amenity value or significant damage to agriculture or commerce. Significant damage to aquatic or other ecosystems, which may result in a substantial adverse change in its functioning or harm to a species of special interest that may endanger the long-term maintenance of the population. Significant damage to crops, buildings or property.
Mild	Exposure to human health unlikely to lead to "significant harm". Equivalent to EA Category 3 pollution incident including minimal or short-lived effect on water quality; marginal effect on amenity value, agriculture or commerce. Minor or short-lived damage to aquatic or other ecosystems, which is unlikely to result in a substantial adverse change in its functioning or harm to a species of special interest that would endanger the long-term maintenance of the population. Minor damage to crops, buildings or property.
Minor	No measurable effect on humans. Equivalent to insubstantial pollution incident with no observed effect on water quality or ecosystems. Repairable effects of damage to buildings, structures and services.

Table X. Description of Severity Classifications

Once the severity and probability of a pollutant linkage has been determined the risk can be assessed using the risk matrix shown overleaf on Table Y.

Risk Matrix

By cross referencing the derived severity and probability in Table Y, below the perceived potential risk can be determined.

		Severity			
		Severe	Medium	Mild	Minor
Probability	High Likelihood	Very High Risk	High Risk	Moderate Risk	Moderate / Low Risk
	Likely	High Risk	Moderate Risk	Moderate / Low Risk	Low Risk
	Low Likelihood	Moderate Risk	Moderate / Low Risk	Low Risk	Very Low Risk
	Unlikely	Moderate / Low Risk	Low Risk	Very Low Risk	Very Low Risk

Table Y. Risk Assessment Matrix

The risk categories detailed above are defined below in the following Table Z.

Term	Description
Very High Risk	There is a high probability that significant harm could arise to a designated receptor from an identified hazard at the site without appropriate remedial action.
High Risk	Significant harm is likely to arise to a designated receptor from an identified hazard at the site without appropriate remedial action.
Moderate Risk	It is possible that without appropriate remedial action, harm could arise to a designated receptor but it is relatively unlikely that any such harm would be severe and if any harm were to occur, it is likely that such harm would be relatively mild.
Low Risk	It is possible that significant harm could arise to a designated receptor from an identified hazard but it is likely that at worst this harm if realised would normally be mild.
Very Low Risk	There is a low possibility that harm could arise to a receptor. In the event of such harm being realised, it is not likely to be severe.

Table Z. Definition of Risk
